

# SECON-DELTA

*Focusing on customer-based mission systems*

We help organizations design and maintain secure system configurations in today's ever-changing technology climate. *We are ready & equipped for immediate deployment CONUS/OCONUS.*

## The SECON-DELTA team

has designed several highly complex information systems in multi-classification environments including Unclassified, Secret, and Top Secret (including SCI). Over the past 13 years, our processes have placed great emphasis on requirements gathering, analysis, prioritization, and architecture development. We analyze the system and present multiple viable options to achieve customer design requirements.

We have strong experience in implementing security controls on multiple network devices. Our team have installed and configured a variety of encryptors, switches, routers, IPS/IDS systems, from many vendors including General Dynamics, Cisco, HP, Brocade, Bricata, Gigamon, and Palo Alto. We conducted configuration on virtual and physical network infrastructures in multiple classifications, utilizing associated information assurance processes and procedures.

## Our Approach

leverages the human elements of a particular customer environment to gather requirements unique to the customer mission. Using in-person (where feasible) and virtual site surveys, SECON-DELTA establishes the groundwork for a mutually beneficial working relationship. We will engage with personnel within leadership, installation, infrastructure support, and mission operators to understand their daily challenges. These challenges will be documented and strategically prioritized into logical categories such as system design, infrastructure, implementation, and maintenance. SECON-DELTA prides itself on its ability to partner with customer stakeholders to comprehend their real-world operational challenges and provide effective solutions that are solid, rapid, and affordable.
